DETAILED ACTION

1. The amendment filed 12/16/08 have been entered and made of record.

Allowable Subject Matter

1. Claims 1-21, 24, 28-59 and 63 are allowed.
2. The following is a statement of reasons for the indication of allowable subject matter: Claim 1 is allowed. Krishmarajah et al. (Pub. No. 2003/0081592 A1) discloses a gateway support node (figure 7, GGSN) operable to provide an interface for communicating the data packets (figure 7, Internet) between the mobile communications_user equipment (User Equipment) and the a_packet data telecommunications network, (figure 7, internet)
a service support node (figure 7, SGSN) operable to communicate the data packets between the gateway support node (GGSN) and the mobile communications user equipment using a radio network controller (Radio Access network (RAN)) , the radio network controller being operable to provide a radio access bearer for communicating the data packets with the mobile communications_user equipment (figure 7, User equipment "UE"),
wherein at least one of the gateway support node and the mobile_communications user equipment are operable to parse the payload data in each data packet to determine a number of the plurality of different data types (figure 12);
to form a transport frame (figure 12, AMR frame) for each data packet by combining the payload data for each data packet with the sub-flow indicator ([0054] subflow) , the transport flame being used to communicate each data packet between the gateway

Art Unit: 2419

(figure 7, GGSN) support node and the radio network controller (figure 7, RCN 104) via the service support node (figure 7, SSGN), and the data packets are communicated between the radio network controller (figure 7, RCN 104).

Lee (Pub. No.: US 2003/0021256 A1) discloses a gateway support node (figure 1, GGSN) operable to provide an interface for communicating the data packets (figure 1, Internet) between the mobile communications_user equipment (User Equipment) and the a packet data telecommunications network, (figure 1, internet) a service support node (figure 1, SGSN) operable to communicate the data packets between the gateway support node (GGSN) and the mobile communications user equipment using a radio network controller (Radio Access network (RAN)), the radio network controller being operable to provide a radio access bearer for communicating the data packets with the mobile communications_user equipment (figure 7, User equipment "UE" 100)

The prior art however fails to disclose wherein at least one of the gateway support node and the mobile_communications user equipment are operable to parse the payload data in each data packet to determine a number of data symbols in each of the different data types, to generate a radio access bearer sub-flow indicator providing an indication of the number of different types of data in the payload and the number of symbols in each different data type, and the mobile_communications user equipment by detecting the sub-flow indicator, and in accordance with the sub-flow indicator arranging for the data from each of the different data fields to be communicated via a different radio access

bearer providing different quality of service parameters appropriate for the different data type

Claims 8, 24, 59, and 63 are allowed. . Krishmarajah et al. '592' discloses providing an interface for communicating the data packets between the mobile communications_user equipment (figure 7, User Equipment (UE) 102) and a packet data telecommunications network (figure 7, Internet), communicating the data packets between the interface and the mobile communications user equipment (figure 7, UE 102) using a radio network controller (figure 7, Radio Access Network (RAN) 104) , the radio network controller (Figure 7, Radio Access Network (RAN) 104) being operable to provide radio access bearers for communicating the data packets to and/or from the mobile communications user equipment (figure 7, UE 102) , wherein the communicating the data packets between the interface and the mobile communications_user equipment comprises parsing the payload data in each data packet to determine a number of the plurality of different types of data (figure 12), forming a transport frame for each data packet by combining the payload data for each data packet with the sub-flow indicator ([0054] subflows) , the transport frame being used to communicate each data packet between the interface and the radio network controller (figure 7, RCN 104) .

Lee (Pub. No.: US 2003/0021256 A1) discloses a gateway support node (figure 1, GGSN) operable to provide an interface for communicating the data packets (figure 1,

Internet) between the mobile communications_user equipment (User Equipment) and the a packet data telecommunications network, (figure 1, internet)
a service support node (figure 1, SGSN) operable to communicate the data packets between the gateway support node (GGSN) and the mobile communications user equipment using a radio network controller (Radio Access network (RAN)) , the radio network controller being operable to provide a radio access bearer for communicating the data packets with the mobile communications_user equipment (figure 7, User equipment "UE" 100)

The prior art however fails to disclose parsing the payload data in each data packet to determine a number of the plurality of different types of data and a numlx,-r of data symbols in each of the different data types, generating a radio access bearer sub-flow indicator providing an indication of the number of different types of data in the payload and the number of symbols in each different data type, forming a transport frame for each data packet by combining the payload data for each data packet with the sub-flow indicator, the transport frame being used to communicate each data packet betwgcgn the interface and the radio network controller, and communicating the data packets between the mobile communications user equipment and the radio network controller by detecting the sub-flow indicator, and in accordance with the sub-flow indicator arranging for the data ~om each of the different data fields to be communicated via a different radio access bearer providing different quality of service parameters appropriate for the different data type;

Claim 14 is allowed. Krishmarajah et al. '592' discloses data packet processing layer (figure 12, data divider 32) , and a user data tunnelling layer operable to provide a virtual channel for communicating the processed data packets via an internet protocol communications layer (figure 12, IP layer processor 36), wherein the data packet processing layer is operable to parse the payload data in each data packet to determine a number of the plurality of different data types (figure 12) to form a transport frame for each data packet by combining the payload data for each data packet with the sub-flow indicator ([0054] subflows) , the transport frame being used to communicate each processed data packet between the gateway support node (figure 7, GGSN) and a radio network controller (figure 7, SGSN) via a 16 service support node (figure 7, SGSN) using the user data tunnelling layer

The prior art however fails to disclose parsing the payload data in each data packet to determine a number of data symbols in each of the different data types, generating a radio access bearer sub-flow indicator providing an indication of the number of different types of data in the payload and the number of symbols in each different data type;
